

# Heatmap

I selected users with different skills (from experienced Linux Systems users to users with no previous knowledge of the gnome env and Linux systems at all):

- User 1: Did not know anything about Linux system previous to the test. Regular Windows user.
- User 2 : Did not know anything about Linux system previous to the test. Regular Windows user
- User 3 : Did not know anything about Linux system previous to the test. Skilled Windows user. Works as a developer Jr.
- User 4 : Works with Linux but never used Gnome previous to the test.
- User 5 : Experienced Linux user. Works with Linux systems for a living. Little knowledge of Gnome environment.

An interesting fact about the tests is that on tasks related to style edition on Gedit 4 out of 5 users experienced serious difficulties to carry out with the task and 2 of them ended up giving up on it. Only the less experienced user successfully completed the task even though it was it's first time using gnome.

Everyone agreed that it was not intuitive for them to check the menu in the tab since it merges with the background of the bar and they were expecting all the options to be on the main menu (placed on the Gedit window). So they got confused about where to find the options they were looking for.

For the calendar nobody seemed to experience difficulties when creating events but not all of them were familiar with filtering event types, hiding or displaying them. Some of them took the guess and the rest didn't know that the tool existed neither how to execute the requested action, so their navigation were vague and preferred not to complete that task.
